**NON-FINAL OFFICIAL ACTION**

***Status of the Claims***

Claims 1-6 are rejected under 35 USC §102.

Claims 7-10 are un not examined on the merits.

***Unexamined Claims***

Claims 7-10 are multiple dependant claims which depend from a multiple dependent.

As per Office policy, these claims are not examined on the merits.

***Rejections under 35 USC §102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-6 are rejected under 35 U.S.C. 102(b) as being anticipated by Sheldon (United States Patent No 6,307,480). As per the claims, Sheldon discloses:

1. A method of monitoring the operation of at least one microcontroller unit (300) that is intended for at least one application and is associated with a system (100), characterized in that

Art Unit: 2113

the microcontroller unit (300) has at least one monitoring module (10) associated with it (column 3, lines 46-51), and in that

the fact that a reset of the microcontroller unit (300) has taken place is acknowledged to the monitoring module (10) by means of at least one confirming signal (column 4, lines 55-63).

2. A method as claimed in claim 1, characterized in that

the confirming signal is formed by at least one trigger signal or trigger code that differs from the normal operation of the microcontroller unit (300) (column 4, lines 34-44) and/or

is permitted only once by the monitoring module (10) (column 4, lines 34-44).

3. A method as claimed in claim 1 or 2, characterized in that,

in relation to the operation of the microcontroller unit (300), a distinction is made between different reset events (column 4, lines 34-44:RS does not clear until Acknowledged) and in that

these different reset events are acknowledged to the monitoring module (10) by means of different confirming signals (ACK is only generated once per reset).

Claim 4 is rejected on the same grounds as claim 1.

5. A base chip as claimed in claim 4, characterized by

Art Unit: 2113

at least one information unit (20) that is provided to allow for different reset events (column 4, lines 34-44), and

at least one supply unit (50) that is connected (52) to the microcontroller unit (300) (it is inherent that a process requires power supply).

6. A base chip as claimed in claim 4 or 5, characterized in that

the monitoring module (10) can be triggered by means of at least one interface unit (30) and/or in that (column 3, lines 46-51).

to distinguish between the individual accesses to the monitoring module (10), different reset events can be marked by different trigger values.
